SENSITEST results January 2015	
Environmental	
House Dust Mites	2

HISTORY:
 From a young age, Lola has suffered with uncomfortable symptoms such as alopecia, itching, pruritus, pyoderma and otitis externa. Skin scrapes were negative and steroids were responsive for a short period. Malaseb, Apoquel and Rilexine were all used to try and control Lola's worsening symptoms but it never cleared up. In January 2015, a sample was taken and sent in for a **SENSITEST** complete allergy test.

ACTION:
 After receiving Lola's environmental and food results, based on the advice from her vet, her owners implemented various changes to help improve Lola's wellbeing. This included changing the bedding to dust mite resistant bedding, steam cleaning their house and giving Lola Nutramega. With Lola's results showing a number of positive food scores, her diet also changed, from ocean white fish, to salmon and potato. However it was the allergen-specific immunotherapy for the house dust mites which helped improve Lola's conditions the most.

Before:
 Lola with her itchy, pruritic skin

*"Since starting the immunotherapy Lola no longer itches, her fur is growing back and she looks less red and angry. She is a much happier and healthier dog. After trying everything, immunotherapy is the only thing we have seen results with."
 - Lola's owner*

After: Lola's skin is much less inflamed, red and itchy,

RESULTS:
 After starting immunotherapy, Lola came off steroids and her over all body condition is much healthier. She is itching less and her skin is much less red. Some of her hair has also grown back.
